

## Centralized

The centralized model consists of one single septic tank followed by the BIONEST™ reactor, the entire system is fed by a collecting system.

## Decentralized

The decentralized system consists of a septic tank followed by the BIONEST™ reactor, to each of the residences. The effluent from BIONEST™ can be channelled to a single point of disposal or can be arranged individually. For this configuration, the BIONEST™ system, as required by the Regulation respecting wastewater disposal systems for isolated dwellings (Q-2, r.8), is certified according to the NQ 3680-910 standard. One of the treatment classes targeted by this standard is class III, which is the advanced secondary category. Bionest offers four (4) models for isolated dwellings which

vary according to the number of bedrooms in the home.

## Semi-centralized

The semi-centralized model is composed of treatment components tailored to each individual dwelling with a portion of the processing being communal. It is our pleasure to introduce you to the best options and help you realize your future projects.
